

Cost-effectiveness of lithium batteries for energy storage in North Africa

Overview

How much does lithium ion battery energy storage cost?

Statistics show the cost of lithium-ion battery energy storage systems (li-ion BESS) reduced by around 80% over the recent decade. As of early 2024, the levelized cost of storage (LCOS) of li-ion BESS declined to RMB 0.3-0.4/kWh, even close to RMB 0.2/kWh for some li-ion BESS projects.

How much does a lithium-ion battery cost?

While lithium-ion may have more costs associated with safety and battery management systems (BMSs), the larger size of other battery technologies can result in higher O&M costs, and their relatively safe operational characteristics work toward lowering O&M costs. A fixed O&M cost of \$ 10/kW-yr was assumed for all battery chemistries in this paper.

How to calculate project costs for lithium-ion battery technology?

To determine the total project costs for the lithium-ion battery technology, for example, the product of the capital and C&C costs and its energy capacity ($4000 \times \$ 372$) is taken. We then add that value to the product of the PCS and BOP costs and the unit's power capacity ($1000 \times \$ 388$).

Will lithium-ion batteries become more expensive in 2030?

According to some projections, by 2030, the cost of lithium-ion batteries could decrease by an additional 30–40%, driven by technological advancements and increased production. This trend is expected to open up new markets and applications for battery storage, further driving economic viability.

Are battery energy storage systems worth the cost?

Battery Energy Storage Systems (BESS) are becoming essential in the shift towards renewable energy, providing solutions for grid stability, energy management, and power quality. However, understanding the costs associated with BESS is critical for anyone considering this technology,

whether for a home, business, or utility scale.

Are battery electricity storage systems a good investment?

This study shows that battery electricity storage systems offer enormous deployment and cost-reduction potential. By 2030, total installed costs could fall between 50% and 60% (and battery cell costs by even more), driven by optimisation of manufacturing facilities, combined with better combinations and reduced use of materials.
