

N-type rectangular double-glass module

Overview

Which bifacial double glass module produces more energy?

The bifacial double glass module produces more energy. Our N-type models have superior bifaciality. This means that the rear side of the module can produce up to 85% of the energy generated by the front side. Thus, the panel generates more energy overall. Lower degradation means a higher return on investment.

What is the preferred structure for the rear side cover of n-type modules?

Dual glass is the preferred structure for the rear side cover of the N-type modules because the glass-glass version can maximize the advantages of the N-type.

How much power does a bifacial glass/glass module produce?

490 - 505 W Max. Efficiency : 22.8 %
Bifacial Module Application Up to 25 % higher electricity yields due to active bifacial glass/glass modules on both sides.
Better Performance Our modules perform better on optimized temperature coefficient.
Excellent Low Light Performance Our modules can also provide higher power output.

How much power does a n-type module produce?

Ultra high power up to 620W The medium-format n-type series modules adopt 210R rectangular silicon wafer design. 210R technology not only breaks through the conventional medium-sized module power output bottleneck of 600W but also optimizes system performance. The bifacial double glass module produces more energy.

How long does a glass-glass bifacial module last?

Besides, glass-glass bifacial modules could provide a minimum of 30 years thanks to the better resistance to corrosion, abrasion, extreme weather, shock, and vibration that ensures N-type module safety during production,

transport, installation and long-term power generation and prevents new invisible cell cracking
